

METHOD, SYSTEM AND PROGRAM PRODUCT FOR TRACKING DATA

ABSTRACT OF THE DISCLOSURE

An improved solution for tracking data wherein communication between an interface and a data application is managed by a pluggable tracking system. In particular, the tracking system is configured to receives a request from the interface, provides the necessary information from the request to the data application, and receives response data from the data application. The tracking system then formats the response data appropriately and forwards a response to the interface. The tracking system can incorporate a set standard for communicating with data applications, thereby allowing multiple data applications to use the same tracking system.
